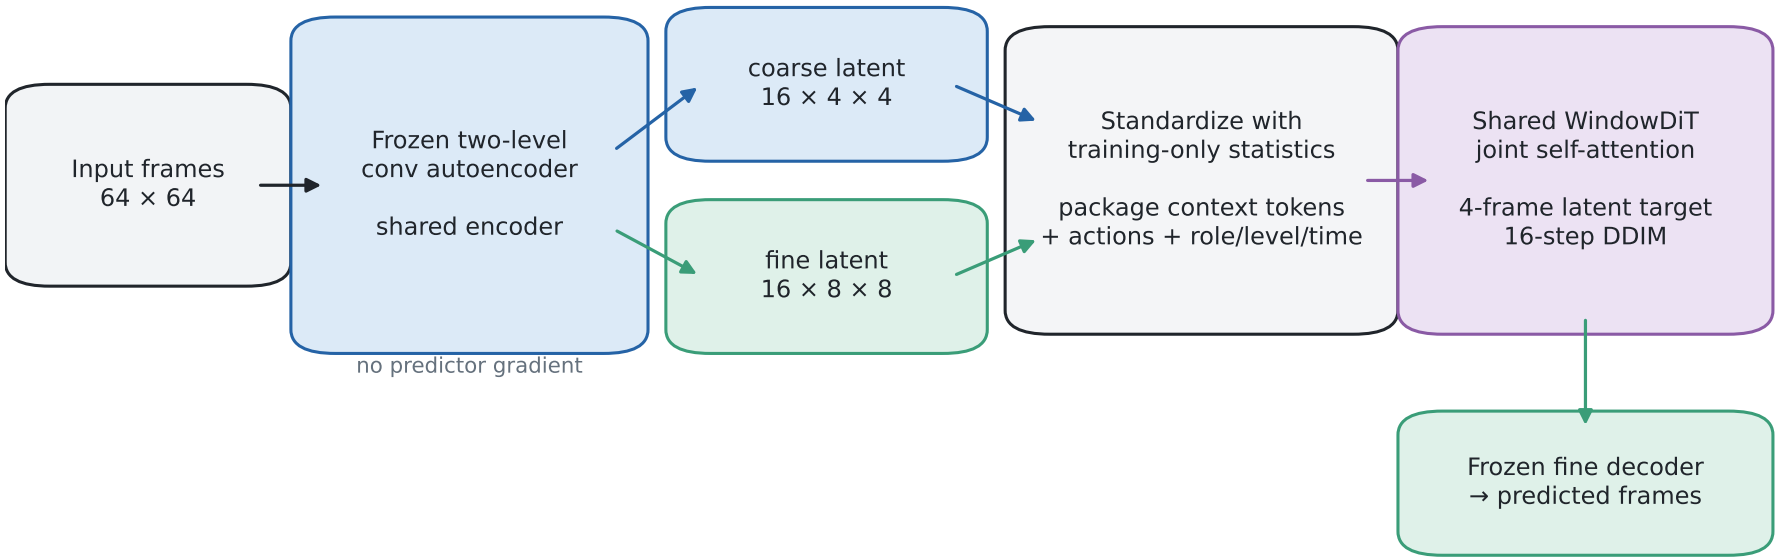
Context packaging is the intervention; reach and fidelity are explanatory properties



Three tested ways to spend context tokens

Flat full resolution	Spatial package	Temporal package
14 × 64 = 896 tokens	48 × 16 + 2 × 64 = 896	11 × 64 + 6 × 64 = 1,088
reach 14 • high fidelity	reach 48 • coarse history	reach 48 • sparse anchors

Target tokens, total sequence length, training regime, sampler work and codec seed are reported separately; equal context tokens do not imply equal total compute.
